Tool details

***FOR RESEARCH USE ONLY**

Name: Anti-ARP6 [12B2.G4.E2.C4]

Alternate name: ARP6

Class: Monoclonal

Conjugate: Unconjugated

Description: Actin-related proteins (ARPs) are found in the nuclei of all eukaryotic cells, but their functions are generally understood only in the context of their presence in various yeast and animal chromatin-modifying complexes. Arabidopsis ARP8 shows 30 and 29% amino acid identity to yeast actin and Arabidopsis ACT2 in the regions of alignment, respectively. Because it is not closely related to yeast or human ARP8 and shows similar weak homology to yeast ARP8 and ARP9, the Arabidopsis ARP8 is considered a plant-specific orphan ARP. Arabidopsis thaliana ARP6 is a clear homolog of other eukaryotic ARP6s, including *Saccharomyces cerevisiae* ARP6, which was identified as a component of the SWR1 chromatin remodeling complex. Arabidopsis ARP6 is localized to the nucleus during interphase but dispersed away from the chromosomes during cell division. ARP6 expression was observed in all vegetative tissues as well as in a subset of reproductive tissues. Null mutations in ARP6 caused numerous defects, including altered development of the leaf, inflorescence, and flower as well as reduced female fertility and early flowering in both long- and short-day photoperiods.

Purpose:

Parental cell:

Organism:

Tissue:

Model:

Gender:

Isotype: IgG1

Reactivity:

Selectivity:

Host:

Mouse

Immunogen: Protein

Immunogen UNIPROT ID:
