Tool details

***FOR RESEARCH USE ONLY**

Name: Anti-CD79a [HM57] rAb

Alternate name: CD79a Molecule; Membrane-Bound Immunoglobulin-Associated Protein; Surface IgM-Associated Protein; MB-1 Membrane Glycoprotein; Ig-Alpha; IGA; CD79a Antigen; MB1

Class: Recombinant
Conjugate: Unconjugated
Description: The B-cell Antigen receptor constitutes a disulphide linked heterodimer, consisting of CD79a (mb1) and CD79b / B29 polypeptides which are non-covalently associated with membrane bound immunoglobulins on B-cells. CD79a first appears at pre B-cell stage and persists until the plasma cell stage where it is found as an intracellular component. CD79a is found in B-cell lymphomas, in B-cell lines, the majority of acute leukemias of precursor B-cell type and in some myelomas. The CD79a/b heterodimer interacts with at least one tyrosine kinase (Lyn). The induction of tyrosine kinase activity after antigen binding leads to phosphorylation of the CD79a/b dimer, and also of other molecules, thereby initiating intracellular signalling. CD79a is widely used as an adjunct to CD20 as a biomarker for normal and neoplastic B-cells in tissues sections.
Purpose:
Parental cell:
Organism:
Tissue:
Model:
Gender:
Isotype: IgG1
Reactivity: Bovine ; Chicken ; Horse ; Human ; Guinea Pig ; Mouse ; Opossum ; Pig ; Primate ; Rat ; Rabbit
Selectivity:
Host: Mouse
Immunogen:

Synthetic peptide of 14 amino acids representing residues 202-216 of the human mb-1 cDNA sequence.
Immunogen UNIPROT ID:
Sequence:
Growth properties:
Production details:
Formulation:
Recommended controls:
Bacterial resistance:
Selectable markers:
Additional notes:

Target details

Target: CD79a (mb1)

Target alternate names:

Target background: The B-cell Antigen receptor constitutes a disulphide linked heterodimer, consisting of CD79a (mb1) and CD79b / B29 polypeptides which are non-covalently associated with membrane bound immunoglobulins on B-cells. CD79a first appears at pre B-cell stage and persists until the plasma cell stage where it is found as an intracellular component. CD79a is found in B-cell lymphomas, in B-cell lines, the majority of acute leukemias of precursor B-cell type and in some myelomas. The CD79a/b heterodimer interacts with at least one tyrosine kinase (Lyn). The induction of tyrosine kinase activity after antigen binding leads to phosphorylation of the CD79a/b dimer, and also of other molecules, thereby initiating intracellular signalling. CD79a is widely used as an adjunct to CD20 as a biomarker for normal and neoplastic B-cells in tissues sections.
